

Feed Weighing

The Rotem Feed Weigher accurately mixes, weighs and records feed consumption.

Consisting of two components; the yellow feed bin with load cell and valve and a Rotem RFS-6 single function controller.

The feed bin offers the facility to mix up to three different feed types by percentage and delivers 25kg of feed at a time. Feeding time periods are set within the controller which records the daily feed consumption of the crop.

The controller will also weigh birds when connected to a weighing platform, this enables monitoring of feed conversion ratios.
